My Peptide Protocol

Breakdown

What I'm taking, why I chose each one, and
what to talk to your doctor about before starting.

by Brooke Hockett | @justbrooketalks

Why I started peptides

I'm a mom of four, I run multiple businesses, and my body was telling me something was off. I have Hashimoto's, which means my immune system attacks my thyroid. That comes with chronic inflammation, brain fog, fatigue, hair loss, gut issues -- things I was told were "just stress" or "just part of being a mom."

I tried everything. Supplements, diet changes, sleep routines. Some helped, but nothing really moved the needle on the inflammation piece. That's when I started researching peptides.

Peptides aren't new. They're naturally occurring chains of amino acids that your body already makes. Therapeutic peptides work by signaling your body to do more of what it already does -- heal tissue, produce collagen, regulate metabolism. Over 80 peptide drugs are FDA-approved, and hundreds more are in clinical trials.

I'm not a doctor. I'm a mom who did the research, found a provider I trust, and started paying attention to what my body was actually telling me. This PDF is me sharing what I've learned.

A note on Hashimoto's and autoimmune inflammation

If you have an autoimmune condition -- Hashimoto's, PCOS, lupus, rheumatoid arthritis -- your body is in a constant state of low-grade inflammation. That inflammation affects everything: your gut, your skin, your hair, your energy, your weight. Peptides don't cure autoimmune disease, but they can help your body manage the downstream effects that make daily life harder than it needs to be.

The three peptides I take every day

BPC-157

GUT + RECOVERY + INFLAMMATION

WHY I TAKE IT

Hashimoto's destroyed my gut. Bloating after every meal, food sensitivities that came out of nowhere, and inflammation that never seemed to go down. BPC-157 supports gut lining repair and reduces systemic inflammation.

WHAT THE RESEARCH SAYS

- Accelerates healing of the gut lining, tendons, ligaments, and muscle tissue
- Reduces inflammatory markers throughout the body
- Supports recovery from musculoskeletal injuries
- Published in Current Pharmaceutical Design, Journal of Physiology

GHK-Cu

SKIN + HAIR + COLLAGEN

WHY I TAKE IT

My hair was thinning and my skin looked dull -- two things that hit different when you're dealing with a thyroid condition. GHK-Cu signals your body to ramp up collagen production and repair skin at the cellular level.

WHAT THE RESEARCH SAYS

- Stimulates collagen synthesis and skin regeneration
- Supports hair follicle growth and thickness
- Provides antioxidant protection at the cellular level
- Published in BioMed Research International

Retatrutide

METABOLIC HEALTH + INFLAMMATION + BLOOD SUGAR

WHY I TAKE IT

This isn't about a number on the scale for me. My metabolism shifted, my blood sugar felt unstable, and the inflammation from Hashimoto's was affecting everything. Reta helps regulate metabolic function, reduce inflammation, and stabilize the things that felt out of my control.

WHAT THE RESEARCH SAYS

- Supports metabolic health across multiple pathways simultaneously
- Reduces systemic inflammation and improves cardiovascular markers
- Phase 2 trial showed up to 82% reduction in liver fat (MASLD)
- Improves blood sugar regulation and insulin sensitivity
- Published in New England Journal of Medicine (2023)

Why these three together

Each peptide targets a different system: BPC-157 for gut and tissue repair, GHK-Cu for skin and collagen, Retatrutide for metabolic and inflammatory balance. Together, they address the three areas that Hashimoto's and chronic inflammation hit hardest. Your stack might look completely different -- and it should, because your body is telling you different things.

What to ask your doctor

I'm not here to replace your medical team. Peptides should be part of a conversation with a provider who understands them. Here are the questions I'd bring to that conversation:

"Are peptides appropriate for my specific health situation?"

Especially important if you have an autoimmune condition, are pregnant or nursing, or take medications that affect your immune system or metabolism.

"What bloodwork should I get before starting?"

A good provider will want baseline labs. Ask about thyroid panel, inflammatory markers (CRP, ESR), metabolic panel, and hormone levels.

"How do peptides interact with my current medications?"

If you're on thyroid medication, metformin, or immunosuppressants, this matters.

"What should I monitor while I'm on them?"

Know what labs to recheck and when, so you can track whether they're actually working for you.

"Where should I source them?"

Ask about third-party testing, purity standards, and what to look for (and avoid) when choosing a supplier.

"What does a realistic timeline look like?"

Peptides aren't overnight fixes. Most take 4-12 weeks to show measurable results. Set expectations with your provider.

Finding a peptide-friendly provider

Not every doctor is familiar with peptides yet. Look for functional medicine practitioners, integrative health providers, or anti-aging/longevity clinics. Many offer telehealth consultations. The right provider won't dismiss your research -- they'll work with you.

WHERE I GET MINE

Trusted sources

I only recommend what I personally use. These are the two platforms I trust:

Track your protocols
